BYPASSING KERATINIZATION

When the skin is traumatised by burning, a thick callous is produced by basal cells in the last layer of the dermis. Within 24 hours the basal cells are there to help protect it. The wonder is that Aloe Gel regenerates the skin so rapidly that the body does not send for help from the basal cells. Underneath the scab is healthy skin tissue.

NATURE'S SOOTHING HEALER by Diane Gage

Aloe is a storehouse of nutrients and medical researchers throughout the world are discovering its healing and soothing properties. It has the ability to kill certain bacteria, fungi and viruses, and to dilate capillaries, which increases the blood supply in the area to which it is applied. Aloe Gel penetrates and anaesthetises injured tissue, and increases cell regeneration at a rapid rate. Contains enzymes that effect chemical changes, which in turn intensify healing. Stimulates the white blood cells in the body, which control the immune system

JOURNAL OF DERMATOLOGICAL SURGERY AND ONCOLOGY

Aloe significantly accelerated healing in patients who had facial dermabrasion, which removes the top layer of skin to eliminate scars.
